Average Fare_Amount_INR

 Average dataset value

Average of numeric column Fare_Amount_INR.

AI ANALYTICS

 Refresh Insights

AI Business Insights

Intelligent insights and recommendations generated from your dataset.

Business Insights

What your data is telling you

1

AI INSIGHT

Dataset contains 10,000 records.

2

AI INSIGHT

Dataset contains 24 unique customers.

3

AI INSIGHT

Dataset contains 3,696 missing values (1.76% of all cells).

4

AI INSIGHT

No duplicate rows were detected.

Recommendations

Suggested actions based on your data

1

💡 AI RECOMMENDATION

Review and handle missing values before predictive analytics.

2

💡 AI RECOMMENDATION

Use price volatility, trend and average-price analysis for deeper asset performance evaluation.

3

💡 AI RECOMMENDATION

Analyze sales trends, top-performing products and revenue contribution to identify growth opportunities.

4

💡 AI RECOMMENDATION

Perform customer segmentation and customer-value analysis to identify high-value customers.

5

💡 AI RECOMMENDATION

Monitor profit, expenses and margins to identify financial improvement areas.

Advanced Analytics

Automated statistical analysis, trends, correlations and anomaly detection.

💡 Analytics Insights

1. Strong Positive correlation detected between Trip_Duration_Min and Fare_Amount_INR (0.77).

2. Fare_Amount_INR contains 395 potential outliers (3.95% of valid observations).

3. Distance_KM contains 305 potential outliers (3.05% of valid observations).

4. Surge_Multiplier contains 303 potential outliers (3.03% of valid observations).

5. Trip_Duration_Min contains 249 potential outliers (2.49% of valid observations).

6. Customer_Rating contains 13 potential outliers (0.16% of valid observations).

7. Distance_KM appears right skewed, which may indicate uneven value distribution.

8. Trip_Duration_Min appears right skewed, which may indicate uneven value distribution.

9. Fare_Amount_INR appears right skewed, which may indicate uneven value distribution.

10. Surge_Multiplier appears right skewed, which may indicate uneven value distribution.

Recommendations

1. Investigate strongly correlated variables to understand potential business drivers and relationships.

2. Review detected outliers before building predictive models because extreme values can influence results.

3. Consider distribution-aware analysis or transformations for strongly skewed numeric variables.

Interactive Data Visualization
